Locked Doors,

Badge ID's, Camera Systems, and armed staff members are but just a few of the many alternatives being considered to make churches safer. Some are too expensive, some ineffective, and some impractical.

The fact is that technology will not make churches safer. The only thing that will work is RAPID RESPONSE in times of emergency. The situation has to be reported, both to those who will respond, and to those who need to take protective measures. Larger churches have paid off duty police officers - Great idea for churches that can afford them, but what about those who can't or those that want improved safety?

PA systems are effective in coordinating lock downs, but useless if the bad guy is between office personnel and the PA system.

The fact is that the key to a good safety plan is quickly identifying, reporting, and responding to life threatening events. We developed the Safe-Church Program to give you the ability to instantly report situations requiring immediate attention, whether it is inside, outside, or somewhere in between; whether it is a situation requiring security staff, professional law enforcement, medical, or fire emergencies.

Our new Safe-Church reporting system is a combination of wireless technology and working relationships with first responders. This allows instant reporting without intervention by third party alarm centers or even 911. Safe-Schools, and a companion program known as Safe-Community are both proven and effective.

In this brochure, we have prepared a brief overview of the fundamental elements of the Safe-Church program.

We will begin with our most popular solutions for getting help in a hurry. All of these products work with existing VHF or UHF 2-way radios!

HELP WHEN NEEDED!

AT THE PUSH OF A BUTTON!

ON YOUR DESK,

IN YOUR HAND,

OR ON YOUR BELT!

THE SAFE-CHURCH PROGRAM

can help get help in a hurry for potential victims of dangerous aggressors!

NeighborNet is a community action plan based on alarm notifications being sent to other participating members. Upon receipt of an alarm, an action plan is initiated for immediate and effective response.

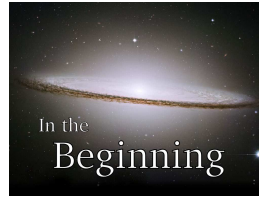

LawDirect provides notification directly to law enforcement agencies with no third party delays as well as nearby *NeighborNet* members to provide coordinated response (An agreement with local law enforcement agencies is required). More info available at: <http://safercommunities.blogspot.com>.

The desktop unit sends a pre-recorded voice message when activated. This message can be received on the belt unit. The personal hand held sending unit activates an emergency call through an associated transmitter. The belt unit can send AND receive emergency calls.

There are no monthly fees or long term contracts. Prices start at just \$349. Call us at 205.854.2611 or drop us an email at ServingU@falcondirect.com for more info or a demonstration at your convenience.

Our initial focus on serving church needs began many years ago in the nursery with the *ParentFinder* wireless notification system.

The idea was, and still is, one of providing a means of contacting parents in time of need while simultaneously offering a positive means of parent/child identification. We still offer these systems. If you have an interest in church nursery paging systems, please visit www.falcondirect.com/ParentFinder.

Much of the technology we offer today is based on the development of wireless call button systems initially used for courtrooms and more recently in schools and in the merchant community. It all gets down to a matter of protecting people, property, and places.

The key to improved people protection is the ability to quickly communicate with others. That is why many churches are using two way radios. Historically, a good quality commercial grade portable radio would cost \$300 or more. Today, we have reduced that cost to under \$150!

The dual band MK-II has the ability to talk on both VHF and UHF frequencies. This makes it ideal for direct communications with law enforcement. The price is right - just \$149! If you would like more information on establishing direct access to law enforcement, see www.info4u.us/ssintro.pdf. This system was initially developed for schools but is also applicable for churches as well. Speaking of low cost radios.....

All of our personal 2-way radios are available with low cost covert operation through the use of optional ear phones and remote microphones. The

ideal radio for church security is our ultra small TC-320. Priced at just \$149, more info available at www.info4u.us/TC-320.pdf.

Not everybody at the door is a good guy! During the week, church staff workers may be all alone in the office. Not a good thing! We've got a solution, originally developed for a day care center. It's called DoorCall! Additional info is available at www.info4u.us/DoorCallers.pdf.

Mass notification via PA systems can save lives in times of emergency. The LoudMouth wireless PA system provides the capability to broadcast information indoors or

outdoors from any of our portable 2-way radios. The installation at Bates College is a good example (Picture above shows dual speaker unit installed at one of the Bates College dormitories). We can interface with an existing wired PA system or provide a complete wireless system at surprisingly low cost. For additional information, please see www.info4u.us/BatesStory.pdf.

On a closing note, you might also want to check out our Assisted Listening System at www.falcondirect.com/ALDs/prices.
