

Want to see how fleet management works?

Let's set up your Internet connected PC so you can monitor my vehicle activity, even send me a text message anywhere that I might be in the USA! To set up easy access to my account, go to <http://onlineavl2.us.navmanwireless.com/OnlineAVLSetup>. The Navman system uses Microsoft .NET Framework Version 2 or later. If you already have Microsoft.Net installed on your Windows or VISTA PC, just click on "Install" or follow the instructions.

A new screen will appear that will prompt you to enter a Username - Enter *navmanshow*. Then enter the password *navmanshow* (Note that they are the same - just be sure all characters are lower case). Double click on my name, Burch (I'll be the first one on the top at the left), to see my present location. A map (a very good one I might add) will appear indicating my last position (positions are updated every 10 minutes) with an indication of whether my ignition switch is on or off if I am parked. If you want to know my speed, move the cursor above the Red arrow indicating my vehicle.

You can Query the current location of my vehicle, generate reports, even send me a text message - try it! Just click on Send Message at the top of the page and type in up to 400 characters. I can answer your message with up to 100 canned messages or type in an individual message. There are lots of other things you can do including setting up a Geo fence to let my co-workers know if I wander outside my assigned area or exceed a designated speed limit.

In my vehicle, I can send messages, get turn by turn driving directions, see the same map you see with the location of all vehicles in the fleet and much, much more! You can monitor when I turn my ignition on or off, and optionally when I open doors, or activate external devices. This Navman MCC is absolutely incredible! More information is available at www.navmansystems.com.
